Program Description: The Mission Hospital Day Treatment Program is a functional therapeutic program for individuals recovering from a trauma or neurological event. The Day Treatment Program provides assessment and treatment in a variety of areas to enable persons served to re-integrate into a productive lifestyle. The program is available to people who were previously independent, but require continued physical and cognitive rehabilitation. The persons served are required to participate in up to three hours of therapy services and community-based activities. Our integrated team model is focused on functional recovery that extends from the hospital to various community services.

Graph Summaries
